

Session 2

1. Install GCC on your computer and verify the installation by running `gcc --version` in your terminal or command prompt

Steps to Install and Verify GCC

1. Download and install GCC (MinGW) on the computer.
2. Add the GCC bin folder to the Environment Variables Path.
3. Open Command Prompt (CMD) on the computer.
4. Type `gcc --version` in the Command Prompt and press Enter.
5. Check the output displayed on the screen.
6. Take a screenshot of the CMD showing the `gcc --version` command and the GCC version.
7. The displayed GCC version confirms that GCC has been successfully installed and is ready to compile C programs.

```
C:\WINDOWS\system32\cmd. X + - X
Microsoft Windows [Version 10.0.26200.9168]

```

Session 2

2. Open VS Code or DevC++ and create a new file named hello.c. Write a C program that prints 'Hello, Instagram World!' to the console.

The screenshot shows the Visual Studio Code editor with a C program named `hello.c` open. The program is a simple C program that prints "Hello, Instagram World!" to the console. The code is as follows:

```
1 //Header
2 #include<stdio.h>
3
4 //Main Function
5 int main(){
6     printf("Hello, Instagram World!");
7
8     // Return statement
9     return 0;
10 }
11
```

The terminal window at the bottom shows the execution of the program:

```
PS C:\Users\hvp\Desktop\Wohmmad-IT\C Language> gcc hello.c -o hello
PS C:\Users\hvp\Desktop\Wohmmad-IT\C Language> ./hello.exe
Hello, Instagram World!
PS C:\Users\hvp\Desktop\Wohmmad-IT\C Language>
```

3. Identify and label the header, main function, and return statement in your hello.c program using comments.

The screenshot shows the Visual Studio Code editor with the same C program `hello.c` open. The program is now annotated with comments to identify the header, main function, and return statement. The code is as follows:

```
1 //Header
2 #include<stdio.h>
3
4 //Main Function
5 int main(){
6     printf("Hello, Instagram World!");
7
8     // Return statement
9     return 0;
10 }
11
```

The terminal window at the bottom shows the execution of the program:

```
PS C:\Users\hvp\Desktop\Wohmmad-IT\C Language> gcc hello.c -o hello
PS C:\Users\hvp\Desktop\Wohmmad-IT\C Language> ./hello.exe
Hello, Instagram World!
PS C:\Users\hvp\Desktop\Wohmmad-IT\C Language>
```

Session 2

4. Compile your hello.c file using the GCC command line (`gcc hello.c -o hello`) and run the output file to display the message in your terminal.

Hint: On Windows, the output file will be `hello.exe`; on Linux/Mac, it will be `hello`.

The screenshot shows the Visual Studio Code interface with a C program named `hello.c` open in the editor. The program's content is as follows:

```
1 //Header
2 #include<stdio.h>
3
4 //Main Function
5 int main(){
6     printf("Hello, Instagram World!");
7
8     // Return statement
9     return 0;
10 }
11
```

The Explorer sidebar on the left shows the file structure with `hello.c` and `hello.exe` listed under the `C Language` folder. At the bottom, the Terminal panel displays the execution of the program:

```
PS C:\Users\hvp\Desktop\Mohammad-IT\C Language> gcc hello.c -o hello
PS C:\Users\hvp\Desktop\Mohammad-IT\C Language> ./hello.exe
Hello, Instagram World!
PS C:\Users\hvp\Desktop\Mohammad-IT\C Language>
```

The status bar at the bottom indicates the current position is Line 11, Column 1, with 4 spaces, UTF-8 encoding, CRLF line endings, and the C language selected.
